Category:1889 births Category:1954 deaths Category:People from Alessandria Category:Italian gastroenterologists Category:Italian surgeons Category:University of Pisa faculty Category:University of Pisa alumniCounting the Cost of Cardiovascular Disease in the U.S. The U.S. spends a lot of money on health care. How do we know? After all, health care expenditures are still rising even as overall health care spending is leveling off. To see what we're spending, the Centers for Disease Control and Prevention (CDC) annually produces a set of reports called the National Health Statistics Reports. These reports present data on the cost and use of services (including drugs, physician visits, hospitalizations, and other health care utilization) that are used to manage and treat diseases and conditions. Each year, the most recent report includes a report of health care expenditures by disease category, as well as an estimate of the total dollar value of care for each disease or health condition. Health care costs are spread broadly across different disease categories. In 2013, for example, health care costs for cardiovascular diseases totaled $444 billion. That was not a particularly high number, but it represented about half of all health care spending. The second-biggest cost category (by dollar value) was mental health and substance abuse, which comprised about 17% of health care costs. Health care spending for mental health and substance abuse totaled $188 billion. On a per capita basis, cardiovascular disease costs were highest in the Midwest (for example, Iowa and Wisconsin), whereas per capita costs for mental health and substance abuse were highest in the West (for example, Alaska and Nevada). The distribution of health care costs by disease category can help us understand who spends what on health care, but it does not tell us how well health care systems are delivering care. For example, health care spending for cardiovascular diseases is still a very important part of the overall U.S. health care budget. But does the U.S. health care system have the capacity to provide high-quality care for people with cardiovascular diseases? In recent years, the CDC has produced a series of reports that
