Q: How to check if a given path is a blob or a directory in python I have the following piece of code: `import glob import os.path def get_dir_contents(dir_path): # returns all contents of a directory path full_dir_path = os.path.join(dir_path, '*') files = glob.glob(full_dir_path) return files`

I am trying to use the return files to get all files of the directory path but all I get is a list of files like: ['file_name', 'another_file_name'] When I try to check if the path I get is an Blob or a directory using the `is_dir` method, I get the following error: `ValueError: is_dir(): expected a string or buffer`

However, when I try `dir(dir_path)`, it says that `dir_path` is a directory. Is there something I am missing? A: If you want to know if a path is a directory, you need to use `isdir`. FILED NOT FOR PUBLICATION JUN 03 2010
